Jumpstart donation process

A gift is a donation request first, then a payment. Bitcoin stores the amount when the invoice is created. Card and crypto become succeeded only if the donor's browser calls back, and that call does not store the amount.

1. Open the page
/donate/jumpstart. No staff header. It can sit in an iframe on the Jumpstart website.

→

2. Save the donor
Name, email, and an optional message. The request is pending and has no amount yet.

→

3. Choose an amount
$10, $25, $100, or any custom amount in US dollars.

→

4. Pay
Card or crypto through the Base USDC widget, or Bitcoin over Lightning.

CARD OR CRYPTO

1. The thirdweb widget takes the payment on Base.
2. If the browser reaches */succeed*, the request is marked succeeded. The dollar amount stays empty.
3. If the tab closes before that call, the gift stays pending with a blank amount.

BITCOIN

1. The server prices BTC and creates a Lightning invoice, valid for 15 minutes.
2. Dollars and sats are stored on the request before the donor pays.
3. The webhook, the page poll, or the background scan marks the invoice paid and the request succeeded.

STEP	WHAT IS WRITTEN	AMOUNT ON THE REQUEST
Continue on the form	Pending donation request	Empty
Create a Lightning invoice	Pending request, plus the invoice	USD and sats, before payment
Lightning payment settles	Succeeded	Copied from the paid invoice
Card or crypto success callback	Succeeded, with a time	Left empty
Browser closes after a card payment	Stays pending	Empty

The staff list shows every saved request, newest first. The wallet line reads Base USDC only, so Bitcoin does not appear there. The donor's message is stored and is not shown in the table.
